Rim and Face - Alignment Knowledge

2. Span the coupling from the mounted bracket with an indicator support rod. 3. Rotate the fixture to 12:00. 4. Attach a face dial indicator with the plunger centered for equal positive and negative travel.

Dial Indicator Alignment - VibrAlign

Dial indicator bar sag describes a bending of the hardware used to support a dial indicator or other part which spans the coupling. The bending action occurs as a result of gravity and cannot be totally eliminated in almost all cases of alignment. Numerous attempts have been made by fixture manufacturers to minimize the amount of sag that occurs; however, none have been successful in Alignment and Couplings, Model 46615 - maintenance.org

The reverse indicator method is another shaft alignment method. It uses two dial indicators, one on each shaft, to measure the parallel and angular misalignment as shown in Figure 2-1. Figure 2-1. Reverse indicator setup. All measurements are taken on the rim of the coupling hubs.

The parallel and angular measurements, made in the vertical plane, are taken at the same time. The same is true

To mount the fixtures follow these steps: 1. With the coupling broken, mount the fixture to the stationary shaft or coupling hub. 2. Span the coupling with a rod. 3. Rotate the fixture to 12:00. 4. Attach the face dial indicator. The dial indicator plunger must be centered for equal positive and

A Practical Guide to Shaft Alignment - Plant Services RPM has coupling offsets of -1.6 mils vertically and 1.0 mil horizontally; both of these values fall within the excellent limit of 2.0 mils. Angularity is usually measured in terms of gap difference.

Coupling Alignment and Shaft Alignment In power

transmission, a coupling alignment is a device used to connect two or more machine shafts together for the purpose of transmitting power. Coupling design factors in many variables, such as horsepower, load, specific gravity, head pressure, torque, shaft sizes, safety factors etc.

Understanding Shaft Alignment: Basics - Efficient Plant

Proper shaft alignment is not dictated by the total indicator reading (TIR) of the coupling hubs or the shafts, but rather by the proper centers of rotation of the shaft supporting members (the machine bearings).

Face Dial Indicator Readings and Angular Misalignment

Face Dial Indicator Readings and Angular Misalignment

The face dial indicator is mounted parallel to the shafts with the plunger making axial contact on a coupling hub. The face indicator is used to measure coupling gap differences. To determine vertical coupling gap difference, the face indicator is set to zero at a vertical position (12:00 or 6:00) and rotated 180 degrees. To determine
