**Parameter Estimation - RellaWiki**

The term parameter estimation refers to the process of using sample data (in reliability engineering, usually times-to-failure or success data) to estimate the parameters of the selected distribution.

**CHAPTER 7 - ESTIMATION OF PARAMETERS**

The objective of the method is to estimate the parameters of the model, based on the observed  $n$  sets of values and by applying a certain criterium function (the observed sets of values are constituted by selected values of the auxiliary variable and by the corresponding observed values of the response variable), that is:

**Parametric model - Wikipedia**

In statistics, a parametric model or parametric family or finite-dimensional model is a family of distributions that can be described using a finite number of parameters.

These parameters are usually collected together to form a single  $k$ -dimensional parameter vector  $\theta = (\theta_1, \theta_2, \dots, \theta_k)$ .
